City // Sync

Our Mission

City/Sync builds programmable coordination infrastructure that enables cities to measure, reward, and execute civic contribution through transparent, rule-based systems integrated within existing public institutions.

The Problem

City/Sync recognizes that our existing administrative structures are limited by their centralized design. They have a finite fiscal capacity and are implemented through bureaucratic processes that were designed for an analog era rather than a digitally networked society.

At the same time, technological innovation is already reshaping how markets allocate capital, and how value is created and distributed at scale. Advances in artificial intelligence are transforming the nature of work itself and destabilizing our current relationship with economic labor systems.

And still, the mechanism through which societies act collectively (local governments and public-sector administration) has not evolved at the same pace. Our civic institutions remain constrained by manual workflows and siloed authority.

If we want to respond to the growing complexity of modern cities, our public administrative systems must evolve into coordination infrastructures that can expand participation and facilitate the execution of collective decisions with the same clarity and efficiency now seen in digital markets.

The Public-Sector needs to upgrade their operating systems.

Our Vision

City/Sync envisions a future in which public administration operates through transparent, programmable coordination infrastructure rather than opaque, discretionary bureaucracies.

In this model, civic contribution is measurable, incentives are explicitly aligned with public outcomes, and governance decisions execute through clearly defined rules integrated within existing municipal processes and structures.

Instead of episodic engagement and fragmented reporting, cities function as continuous coordination networks where citizens and institutions are connected through accountable, rule-based systems.

The goal is to upgrade the operating system of public-sector institutions by improving its operating capacity by increasing participation and establishing trust through infrastructure that makes collective action visible and executable.

Civic-Labor Credits

The foundation for our vision is the establishment of a Civic-Labor Credit (CLC) system.

A CLC is a non-speculative, non-transferrable, contribution-based accounting unit that is issued when verified civic tasks are completed and later redeemed and burned for access to goods or services within a bounded local network. It is not a currency, but a programmable coordination instrument designed to formalize and measure civic contribution.

Without a formal incentive layer, attempts to build more complex programmable administrative systems lack economic grounding.

A Civic-Labor Credit system anchors administrative innovation in measurable throughput rather than abstract ideology. It creates a disciplined supply mechanism tied to real work performed and a redemption sink tied to real institutional capacity.

It transforms civic contributions from a moral appeal into an accountable exchange.

Civic-Labor Currency (CLC's)

Understanding the Roles

There are 3 major roles within the Civic-Labor Credit system:

Issuers are public-sector organizations that issue civic-labor tasks which expand their public-service mission.

- ➔ Issue tasks for public execution.
- ➔ Responsible for verifying that civic tasks were completed
- ➔ Sets credit rates and issues credits for each task performed.

Redeemers are organizations that offer access to goods and services.

- ➔ Create Incentives for participants to claim and execute Issuer tasks
- ➔ Responsible for burning credits upon redemption.
- ➔ Sets redemption rates for goods and services based on demand.

Civic Participants - Individuals who claim and execute civic-labor opportunities provided by Issuers, earn and redeem credits.

- ➔ Claims and executes Issuer tasks
- ➔ Redeems credits in exchange for access to public goods/services.
- ➔ Participates in the governance of the system.

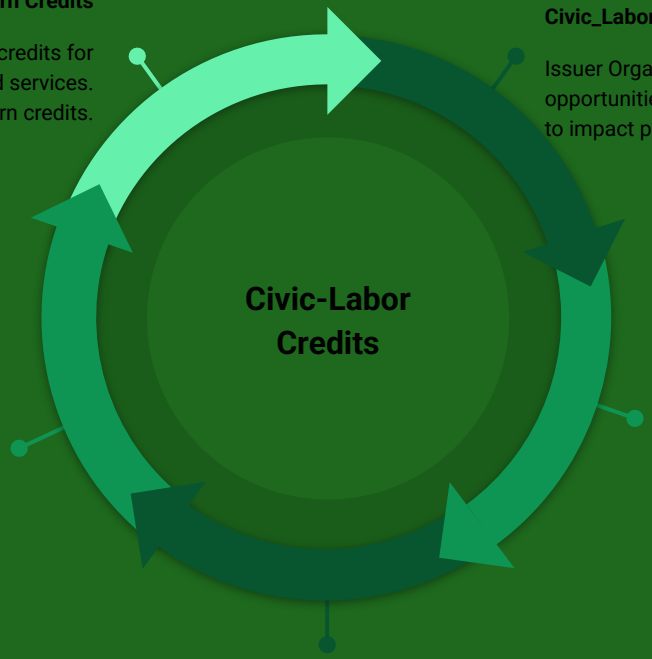
How It Works

Redeemer Organizations Burn Credits

Once Civic-Participants exchange credits for access to public-goods and services. Redeemer Organizations burn credits.

Civic_Labor Issuance Opportunities

Issuer Organizations offer Civic Contribution opportunities that expand the organizations' capacity to impact public-sector mission and goals.



Redeemer Organizations Offer access to goods and services

Civic Participants who hold credits can browse redemption offerings from Redeemer Organizations who set rates for their goods/services..

Civic Participants Claim Issuer Opportunities

Civic Participants can browse civic-labor opportunities and execute in collaboration with Issuer Organizations.

Verification & Issuance of Credits

Once tasks are completed and verified, Issuer Organizations can Mint credits and issue them to Civic-Participants

Governance of Roles

	Authority Functions	Eligibility Requirements	Governance Domains
Issuer Representative Council (Issuers)	• Create Approved Tasks • Approve Verifiers • Confirm Task Completion • Trigger Credit Issuance	• Incorporated Public-Service Organization • Demonstrated Local Service History • Operational Capacity to guide Volunteers • Agree to Network Governance Protocol	• Task Catalogs & Standards • Credit Issuance Limits • New Issuer Onboarding and Approval • Credit Issuance Rules
Redeemer Representative Council (Redeemers)	• Redemption Rate Frameworks • Burn Transparency Requirements • Supply-Demand Adjustments • Consumer Protection Standards	• Incorporated Public/Private Organization • Capacity to deliver goods/services • Agree to Network Governance Protocol	• Redemption Rate Frameworks • Burn Transparency Requirements • Supply-Demand Adjustments • New Redeemer Onboarding and Approval
The Civic Representative Council (Civic Participants)	• Task Quality Feedback • Issuer Evaluations • Representative Council Selection • Parameter Votes (Task rates/categories)	• Capable of executing claimed tasks. • In-Person onboarding onto the Network • Agree to Liability Waiver requirements • Agree to Network Governance Protocol	• Task Quality Feedback • Issuer Evaluations • Representative Council Selection • Parameter Votes (Task rates/categories)

The City/Sync Pilot Framework

The City/Sync Pilot Framework establishes a deployment model through which cities can onboard into programmable public coordination infrastructure. Its purpose is to demonstrate how institutional authority and structured civic participation can operate within a unified administrative environment while remaining governable and replicable.

The pilot is designed to produce operational precedent. It introduces the procedural, economic, social, and governance conditions required for cities to coordinate participation as a functional component of public service ecosystems rather than as an informal or peripheral activity.

This proposed framework seeks to implement a pilot across two distinct governance contexts, one in Berkeley, California and another in Mexico City, Mexico. The goal is to validate that programmable coordination can be adopted within varied institutional environments without requiring structural disruption to existing administrative systems.

Four objectives guide the deployment:

- Establish a repeatable municipal onboarding process. (Procedural)
- Validate participation issuance and service redemption mechanisms and processes. (Economic)
- Validate the concept of Mass Coordination Events (MCE) as a method for bootstrapping local administration. (Social)
- Expand the issuer and redeemer ecosystem through real-world operational use. (Governance)

Together, these objectives support a larger outcome that makes programmable public coordination observable and adoptable by cities.

Logo

Go-to-market strategy

The City/Sync Pilot Program will seek to validate:

CLC Mechanisms

Issuance, Verification, and Redemption Mechanisms which cover Mint, Transfer, and Burn functions.

Issuer Org. Impact

Increase Task Catalog and public participation in issuer tasks leading to greater impact of organizational mission.

Mass Coordination Event (MCE)

Validate the MCE process. Issuers will collaborate on a City Wide initiative with a wider range of temporary redemption offers from both public and private institutions.

Low-Friction Redemptions

Enable Redeemers to modify redemption costs, provide access to goods and services, and remove redemption classes that provide a streamlined and frictionless experience.

Network Governance Systems

Validating Governance System for Issuers to manage the **approval** of new Issuers and task catalogs with Credit Allocations. LIkewise with Redeemers.

Governance committee for each layer.

Phase 0: Initiating the City/Sync Framework

What we seek, and what it will accomplish:

We are looking to raise $35,000 to successfully implement Phase 0 of our Roadmap.
Our milestones for Phase 0 includes:

Onboarding Organizations

We will be onboarding a minimum of 2 Issuer organizations as well as 2 Redeemer Organizations into the City/Sync Framework.

During Phase 0, we will establish processes and expectations for organizations that include comprehensive Governance Systems, and how to further onboard new issuers as we move forward in the evolution of the pilot program.

Deployment Playbooks

In addition to implementing the onboarding procedures, we will develop comprehensive documentation for how to deploy pilot programs in other cities using the City/Sync Framework.

This will include how to identify ideal Issuer and Redeemer organizations, who to engage with in our local governments, and marketing guides to make sure these pilots can be replicated.

Smart-Contract Deployment

We will launch our smart-contracts on a mainnet L2 for the purpose of the pilot.

These contracts will have at least 2 private audits, and will be secure enough for the purpose of the pilot program.

In addition to basic smart-contracts, we will develop monitoring dashboards to record and report activity during Phase 0.

Mobile-Application Design

DWe will design the framework for a mobile wallet application that will facilitate all the functions within our smart-contracts and allow for Issuers, Redeemers, Verifiers, and Civic-Participants to execute their roles.

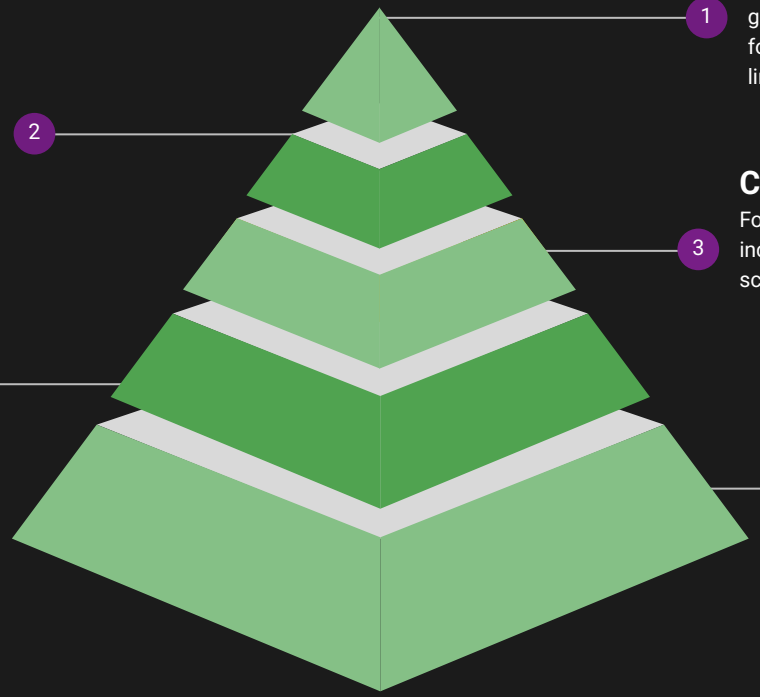
We will also design profiles, and customized governance infrastructure sections within the mobile wallet application.

dPAN & Local Chain Infra

The final vision of the City/Sync framework, where local chains integrate with local governments to serve as the dominant method for collective action that can scale beyond city limits.

CLC & Role Governance

The Governance Systems that manage a Public-Sector economy and how public institutions collaborate toward collective goals.



Civic-Labor Credits

Foundational mechanisms that create the incentive engine for collective action at scale.

Role Architecture & Institutional Legitimacy

Structured roles with eligibility requirements for Issuers, Redeemers, Verifiers, and Civic Participants.

Civic Labor & Public Needs

Real-world civic tasks and public goods demand. Creating fundamental contribution pathways for individuals & organizations is essential for a Public-Sector economy.
